To: Jim Anderson From: Bert Buell

Firm: URS cc: _____

Facsimile: 216-622-2464

Subject: Field Records

Message: Accompanying are:

- Gascoyne GW monitoring Reports for 6/16.
- Gascoyne COCs for 6/16.

I will send out an email this evening to Mike Arbaugh addressing some of the concerns we discussed regarding the COCs. I discussed them w/ the Gascoyne Field Tech today.

Give me a call if you want to discuss. (240-731-4084)

Bert

Field Sampling Summary Report

Work Order No: 0211084

Page 1 of 1

Client: Bethlehem Steel Corporation

Monitoring wells were purged and sampled by Gascoyne Laboratories, Inc. personnel:

Collection date(s): November 04 & 05, 2002

Facility: Bethlehem Steel Corporation

City: Sparrows Point, Maryland

Comments/Observation:

Nine (9) wells were purged and sampled as requested by SAIC. Low flow technique was utilized for purging and sampling of the designated wells. See the attached Groundwater Monitoring Reports for well specifics.

Site locations designated by: Todd Eaby of SAIC

Gascoyne Laboratories Inc. sampler: Craig Mosier (1306 CM)

Notes:

1. All samples preserved (when applicable) on site, placed in appropriate containers, and transported to the laboratory by Gascoyne Laboratories, Inc. personnel.
2. Metals were filtered in the field utilizing a 0.45-micron disposable filter.

Michael Arbaugh Sr.

| 1634 | | | | | | | | 5.2 gal | 36.24 | Turbidity increase |
| 1635 | pumping stopped again at ~ 36.6' | | | | | | | | | |
| 1644 | Restarted pump to collect sample | | | | | | | | | |

PURGE INFORMATION:

Time/Date Started: 1557 | 1/10/03
 Time Purge End: 1617
 Purge Rate(s): 0 pump dependent (gpm)
 Purged Volume: ~7 (gal.)
 Purge Method: pump X bailed _____
 Water Quality Instrument: Hanna U-10 14592
 Pump Type and ID: Typhoon
 Depth(s) to Intake: 70'
 Water Containerized/Amount? yes
 PID Scan of Wellhead? no
 How was yield measured? Bucket gauge
 Did the well cavitate? YES _____ NO X
 Other: _____

SAMPLING INFORMATION:

Time/Date Started: 1647 | 1/10/03
 Sampled by: CAH & CB
 Sample Method: n/s
 Recovering Water Level Depth: 36.1'
 Parameters to be Analyzed: _____
 Number of Bottles Collected: 2
 Bottle Preservatives: HCl
 Duplicate Sampling? n/a
 Date Laboratory Received: 1/11/03
 Results to be Sent to: _____
 Sample: grab X composite _____ other _____
 COC Form No.: JAN03-9
 Other: _____

ADDITIONAL INFORMATION: (i.e. weather conditions, problems encountered, maintenance required, unusual color/odor, etc.) turbid sample

Attached flow sheet

PURGE INFORMATION:

Time/Date Started: 1030 | 1/9/02
 Time Purge End: 1110
 Purge Rate(s): 0.11 (gpm)
 Purged Volume: 4 (gal.)
 Purge Method: pump bailed _____
 Water Quality Instrument: Horiba U-10 (14614)
 Pump Type and ID: 2" Grundfos (14662)
 Depth(s) to Intake: _____
 Water Containerized/Amount? no
 PID Scan of Wellhead? n/a
 How was yield measured? bucket gauge
 Did the well cavitate? YES _____ NO
 Other: _____

SAMPLING INFORMATION:

Time/Date Started: 1109 | 1/9/02
 Sampled by: CAH &
 Sample Method: Grab
 Recovering Water Level Depth: above
 Parameters to be Analyzed: _____
 Number of Bottles Collected: 2
 Bottle Preservatives: Hee
 Duplicate Sampling? _____
 Date Laboratory Received: 1/9/02
 Results to be Sent to: _____
 Sample: grab composite _____ other _____
 COC Form No.: JAN03-5
 Other: _____

ADDITIONAL INFORMATION: (i.e. weather conditions, problems encountered, maintenance required, unusual color/odor, etc.) Initial purge rate too high resulting in ~4' draw down
Flow through in direct sunlight

runs
1

ADDITIONAL INFORMATION: (i.e. weather conditions, problems encountered, maintenance required, unusual color/odor, etc.) Total purge time = 4.5 hours.

Sample likely not representative due to low conductivity, low PID reading + large amount of H₂O (>600 gal) used to drill

PURGE INFORMATION:

Time/Date Started: 1246 | 1/15/02
Time Purge End: 1335
Purge Rate(s): 0.68 (gpm)
Purged Volume: 28 (gal.)
Purge Method: pump X bailed
Water Quality Instrument: Hanna U-10 (14614)
Pump Type and ID: 2" Grundfos 14162
Depth(s) to Intake: 123'
Water Containerized/Amount? yes
PID Scan of Wellhead? n/a
How was yield measured? bucket gauge
Did the well cavitate? YES _____ NO X
Other: _____

SAMPLING INFORMATION:

Time/Date Started: 1334 | 1/15/02
Sampled by: _____ & _____
Sample Method: _____
Recovering Water Level Depth: _____
Parameters to be Analyzed: _____
Number of Bottles Collected: 2
Bottle Preservatives: HCl
Duplicate Sampling? n/a
Date Laboratory Received: 1/15/03
Results to be Sent to: _____
Sample: grab X composite _____ other _____
COC Form No.: JAN03-17
Other: _____

ADDITIONAL INFORMATION: (i.e. weather conditions, problems encountered, maintenance required, unusual color/odor, etc.) Water - brown w/ hint of red

PURGE INFORMATION:

Time/Date Started: 1330 | 1/24/03
 Time Purge End: 1453
 Purge Rate(s): 1.1 / 0.6 see above (gpm)
 Purged Volume: 55 (gal.)
 Purge Method: pump bailed _____
 Water Quality Instrument: Hanna U-10 (14614)
 Pump Type and ID: Super Whaler 1 Prosonic
 Depth(s) to Intake: _____
 Water Containerized/Amount? yes
 PID Scan of Wellhead? n/a
 How was yield measured? Bucket gauge
 Did the well cavitate? YES _____ NO
 Other: _____

SAMPLING INFORMATION:

Time/Date Started: 1452 | 1/24/03
 Sampled by: _____ & _____
 Sample Method: _____
 Recovering Water Level Depth: _____
 Parameters to be Analyzed: _____
 Number of Bottles Collected: 2
 Bottle Preservatives: HCl
 Duplicate Sampling? NA
 Date Laboratory Received: 1/24/03
 Results to be Sent to: _____
 Sample: grab composite _____ other _____
 COC Form No.: JAN 03-24
 Other: _____

ADDITIONAL INFORMATION: (i.e. weather conditions, problems encountered, maintenance required, unusual color/odor, etc.) _____

APPENDIX C

Appendix C
Data Assessment Report
ISG Sparrows Point, Inc. Facility
Site Wide Investigation
Report Date: November 29, 2004

I. INTRODUCTION

A total of 93 groundwater samples, 12 equipment and field blanks, and 16 trip blanks, were collected from May, 2004 through September, 2004 for the ISG Sparrows Point, Inc. facility. All samples were submitted to the Gascoyne Division of Microbac Laboratories, Inc. (Gascoyne) for the analysis. Samples for methane analysis were subcontracted to GPL Laboratories, LLLP (GPL). The requested analytical parameters included the methods listed below.

- Volatile Organic Compounds (VOCs) by SW846 Method 8260B
- Semivolatile Organic Compounds (VOCs) by SW846 Method 8270C
- Total and Dissolved Metals by SW846 Method 6010B/6020/7470A
- Available Cyanide by OIA-1677
- Total Cyanide by SW846 9010/9012A
- Sulfide by SW846 9030B/9034
- Alkalinity by EPA 310.1
- Chloride by EPA 325.3
- Ferrous Iron by SM 3500 Fe D
- Nitrate by EPA 353.2
- Sulfate by SW846 9038
- Methane by GPL RSK-175

Tables 1.1 through 1.3 identify all samples collected with the corresponding laboratory identification. Samples are organized by analytical data package or Sample Delivery Group (SDG). The corresponding Data Assessment Summary Table for each SDG is also identified in Table 1.1. These tables include any data qualification, by sample and parameter, required as a result of the data assessment.

Full validation was performed for initial samples collected. Full validation includes an evaluation of the analytical data and supporting documentation to verify that data are easily traceable and sufficiently complete to permit logical reconstruction by a qualified individual other than the originator. Findings from the full data validation are included in Attachment 1 of this appendix. A standard review for data quality was performed by URS Corporation (URS) for all samples listed in Tables 1.1 through 1.3. A standard review does not include reconstruction of the analytical data, but does include assessment of supporting quality control (QC) parameters and a review for compliance with the cited methods. A standard review was also performed for samples collected from December 2002 through February 2003. The findings from that assessment are included in Attachment 2. The following information was reviewed in the standard review:

- Case Narrative
- Chain-of-Custody documents
- Laboratory sample ID and URS sample ID
- Sample matrix
- Sample results by sample, by analytical fraction
- Analytical method performed
- Units of measure
- Analysis detection limits
- Laboratory data qualifiers
- Date samples were extracted and/or analyzed
- Percent moisture (where applicable, for solid sample dry weight determination)
- Surrogate recoveries (where applicable)
- Internal Standards (where applicable)
- Laboratory Check Samples (LCS) results
- Laboratory Method Blank results
- Matrix Spike/Matrix Spike Duplicate/Duplicate results
- Electronic Data

Guidance documents for the assessment process included the referenced analytical methods and the "Region III Modifications to National Functional Guidelines for Organic Data Review" (November 1994) and the "Region III Modifications to National Functional Guidelines for Inorganic Data Review" (April 1993).

II. DATA ASSESSMENT

The sections below describe the data assessment procedures performed, and any resultant findings. Data qualifications as a result of this assessment are itemized in a Data Assessment Summary Table for each analytical data package. Unless otherwise noted, the acceptance criteria described in each section were met for each sample, and no qualifications were required.

A. Sample Receipt and Handling

The Chain of Custody and sample receiving documents are reviewed for correct sample identifications, preservatives, temperatures, dates, signatures, and condition of the containers and custody seals upon receipt. Lack of proper preservation could result in qualification or rejection of data, depending on the specific parameters and severity of the exceedance. Other discrepancies or deficiencies could require contacting the laboratory for additional information, and are assessed in accordance with the guidance documents on a case-by-case basis.

All samples were received at the laboratory under custody and intact. In a few cases, sample field identification was not listed on the COC or required revision per URS' instruction. These modifications are specified on the Data Assessment Summary Tables. The login documents indicated that all samples were received at temperatures within criteria. SW-846 preservation guidelines require that samples be maintained at $4\pm 2^{\circ}\text{C}$. No results were qualified.

B. Holding Time Criteria

Analyses are reviewed for compliance with the required holding times. Analyses performed after the holding times are qualified according to the severity of the exceedance. Most analyses were performed within the method-required holding times. However, for the instances where holding time exceedances occurred, the affected samples requiring qualification are identified in the Data Assessment Tables.

C. Blank Evaluation

Blank samples include laboratory method blanks, field equipment blanks, and trip blanks. Blanks are evaluated to determine whether conditions exist resulting in reported sample concentrations that are not related to site conditions (i.e., if samples are contaminated from an external source). Contamination introduced from an external source is demonstrated when an analyte is detected in a blank, and the concentration in an associated sample is not significantly higher. Specifically, if the sample concentration is less than five times the blank concentration (or ten times for common laboratory contaminants such as acetone, methylene chloride, 2-butanone, and phthalate esters), it may be assumed that the analyte was introduced from an external source and was not actually present in the samples. The result is, therefore, qualified as non-detect (U) at the reported concentration, or at the laboratory reporting limit (RL), whichever is higher. If the sample concentration is greater than five times the associated blank concentration (or ten times for common contaminants), the amount attributable to external contamination is considered negligible and the reported chemical concentrations are actually present (i.e., no qualification is required).

Method blanks were analyzed with all analytical batches. Trip blanks and equipment blanks were also submitted with the project samples.

Low concentrations of selected target analytes were detected in several of the trip blanks and equipment blanks. Trace amounts of target analytes were also detected in laboratory method blanks.

Based on the concentrations detected in the various blanks, a number of positive results for the affected compounds reported by the laboratory were qualified as non-detect (flagged "U") at either the reporting limit or the value reported, as appropriate. The findings presented in Data Assessment Summary Tables reflect these qualifications.

D. Surrogate Recoveries (Organic Analyses)

Surrogates are chemicals not normally found in nature, but chemically behave in a similar fashion as the target analytes. Surrogate spikes are added prior to sample preparation for organic analyses and are used to evaluate the effects of the sample matrix on the extraction efficiency and/or instrument response. Surrogate recoveries are evaluated against QC acceptance limits established by the laboratory.

Most surrogate recoveries for project samples were within acceptance criteria and no qualifications were necessary. However, for select samples low surrogate recoveries were observed. Associated data were estimated if recoveries were below the QC acceptance criteria, but $\geq 10\%$. However, for significantly poor recoveries (i.e., $< 10\%$), associated nondetect results were rejected and positive concentrations were qualified as estimated.

E. Internal Standards (Organic Analyses)

Internal standards are used for GC/MS analyses to ensure that the system sensitivity and response are stable for every run, and for the quantitation of analyte concentrations. Internal standards are added to all samples, calibration standards, method blanks, matrix spikes, and LCSs. Internal standard responses should be $\geq 50\%$, but $\leq 200\%$ of the corresponding response in the daily reference standard. If internal standard responses are outside of those limits, associated data are qualified as estimated or rejected, depending on the severity of the exceedance.

Internal standard responses for most project samples and associated QC samples met method criteria. However, moderately low responses for internal standard were identified for some samples as identified in the Data Assessment Summary Tables. All results associated with the affected internal standard(s) were qualified as estimated (flagged "J" or "UJ").

F. Laboratory Control Samples

A Laboratory Control Sample (LCS) is a "contaminant-free matrix" spiked with a known concentration of all analytes of interest or a representative subset of the target analytes. The LCS is carried through the complete sample preparation and the analytical procedures and thereby provides information on the method's performance. Percent recoveries are monitored to provide a continuous measure of each method's accuracy. The LCS recoveries are compared with established method performance criteria to determine data acceptability. Associated samples are qualified in a manner similar to that described for surrogate recoveries.

Most LCS recoveries associated with the project samples were within the established acceptance limits. However, where exceedances, occurred the associated results were qualified to indicate the potential bias (i.e., "K" for positive bias due high recoveries and "L" for low bias due to low recoveries).

G. Matrix Spike/Matrix Spike Duplicate/Laboratory Duplicate

An aliquot of the sample matrix is spiked with a known concentration of all compounds of interest to obtain Matrix Spike and Matrix Spike Duplicate (MS/MSD) samples. The MS/MSD samples are subjected to the entire analytical procedure in order to determine both accuracy and precision of the method for the matrix by measuring the percent recovery and the Relative Percent Difference (RPD) of the two spiked samples. These samples are used to assess matrix interference effects on the method, as well as to evaluate instrument performance. The matrix spikes do not control the analytical process but are used (in conjunction with the LCS) to evaluate the effect of the matrix on analytical performance. Associated data (the spiked sample or samples with a like matrix) are qualified following criteria similar to the LCS.

Several MS/MSD recoveries exceeded the established acceptance limits. If the recoveries were below the acceptance limits, but $\geq 10\%$, a negative bias was assumed and affected data were qualified as estimated (flagged "L" or "UL"). If the recovery was significantly poor (i.e., $< 10\%$) then associated nondetect data were rejected and positive concentrations were qualified as estimated. If recoveries were above the acceptance limits, only positive concentrations were qualified as estimated ("K") due to the potential positive bias.

Several RPD values also exceeded established acceptance limits. Associated data were qualified as estimated due to the poor spike precision.

The results requiring qualification are listed in Data Assessment Summary Tables included with this report.

H. Duplicate/Replicate Samples

Duplicate or replicate samples are analyzed to monitor and estimate the precision of data generated. Field duplicate samples are also an indicator of the representativeness of the samples collected. If significant differences between analyses are identified, associated data are qualified as estimated.

Field duplicate samples were collected throughout the sampling effort. Acceptable precision was demonstrated for most of the field duplicate pairs for all parameters. However, various exceedances were noted and affected data are estimated (flagged "J") due to poor duplicate precision as noted on the Data Assessment Summary Tables.

I. Dilutions and Reporting Limits

The reporting limits for all other analytes were consistent with project requirements and were adjusted properly for dilutions where necessary.

J. Miscellaneous Comments

Gascoyne qualifies positive inorganic results below the RL, but greater than one-half the reporting limit with a "B" qualifier. The laboratory qualifier was revised to a "J" to indicate an estimated value and to be consistent with Region III guidelines.

Identifying analytical batches for QC was difficult. Batch numbers were often not reported and/or did not correlate with the reported QC (e.g., LCS and method blank). Where necessary, correlation of batch QC to the project samples were based on analytical dates and/or assumed to be reported correctly by the lab.

Documentation was often incomplete or incorrect. Additional documentation was provided for samples not in the SDG. Furthermore, the case narratives included excess information not necessarily related to the project samples. Conversely, incorrect QC results and/or missing forms were noted on several occasions. In cases where reasonable assumptions regarding the applicability of the QC elements provided (i.e., the review items mentioned in Section I) could not be determined, associated data were qualified as estimated.

All sulfide results were qualified as biased low (L) since the method performed, as cited by the laboratory, does not include the distillation step as in the requested SW846 Method 9030B.

III. DATA QUALIFIERS

The following data qualifiers were used to indicate data usability. The final data set, as qualified, is presented in the Data Assessment Summary Tables.

- U** = The analyte was analyzed for, but was not detected. Value shown is the reporting limit.
- R** = Unreliable result. The analyte may or may not be present in the sample.
- J** = Estimated concentration because the result was below the sample reporting limit or quality control criteria were not met.
- UJ** = The analyte was not detected at or above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- K** = Analyte present. The reported value may be biased high. Actual value is expected to be lower.
- L** = Analyte present. The reported value may be biased low. Actual value is expected to be higher.

UL= Not detected, quantitation limit is biased low (expected to be higher).

The objective of this data assessment was to determine and document the quality and usability of the project data. Taking into consideration the qualifications described in this report (and any resulting bias), 100% of the data are considered usable.

 Laboratory Data Assessment Summary
 Data Package #0407110
 ISG Sparrows Point, Inc.

| Sample ID | Parameter | Comments |
|----------------------------|-----------|---|
| 0407110-001 CP14-PZM062 | VOCs | <ul style="list-style-type: none"> ▶ The results for 2-butanone (5 JB ug/L) and methylene chloride (2.1 B ug/L) were changed to 5 U and 2.1 U ug/L, respectively, due to contamination identified in the associated lab and/or field blanks. ▶ The acetone result was reported from a 50-fold dilution. All other results were reported from the undiluted analysis. |
| | SVOCs | None |
| | Metals | <ul style="list-style-type: none"> ▶ Results for dissolved antimony and total and dissolved chromium were qualified as nondetect ("U") at the reported concentration due to contamination identified in the method blank. ▶ Laboratory B-flags to indicate positive concentrations below the RL were revised to J-flags to be consistent with Region 3 guidelines. |
| | Misc. | ▶ The sulfide result was qualified as biased low ("L") since the cited method does not include the the distillation step in the requested SW846 Method 9030B. |
| 0407110-002 CP16-PZM018 | VOCs | ▶ The results for 2-butanone (4 JB ug/L) and methylene chloride (2.8 B ug/L) were changed to 5 U and 2.8 U ug/L, respectively, due to contamination identified in the associated lab and/or field blanks. |
| | SVOCs | None |
| | Metals | <ul style="list-style-type: none"> ▶ Results for total antimony and total and dissolved chromium were qualified as nondetect ("U") at the reported concentration or the RL (whichever higher) due to contamination identified in the method blank. ▶ Laboratory B-flags to indicate positive concentrations below the RL were revised to J-flags to be consistent with Region 3 guidelines. |
| | Misc. | ▶ The sulfide result was qualified as biased low ("L") since the cited method does not include the the distillation step in the requested SW846 Method 9030B. |
| 0407110-003 CP16-PZM035 | VOCs | ▶ The results for 2-butanone (9.9 B ug/L) and methylene chloride (2.7 B ug/L) were changed to 9.9 U and 2.7 U ug/L, respectively, due to contamination identified in the associated lab and/or field blanks. |
| | SVOCs | ▶ The bis(2-ethylhexyl)phthalate result was reported from a secondary dilution. |
| | Metals | <ul style="list-style-type: none"> ▶ Results for total and dissolved chromium were qualified as nondetect ("U") at the reported concentration due to contamination identified in the method blank. ▶ Laboratory B-flags to indicate positive concentrations below the RL were revised to J-flags to be consistent with Region 3 guidelines. |
| | Misc. | ▶ The sulfide result was qualified as biased low ("L") since the cited method does not include the the distillation step in the requested SW846 Method 9030B. |
| 0407110-004 CP08-PZM008 | VOCs | <ul style="list-style-type: none"> ▶ The results for 2-butanone (180 JB ug/L), acetone (140 J ug/L), and methylene chloride (150 B ug/L) were changed to 250 U, 250 U, and 150 U ug/L, respectively, due to contamination identified in the associated lab and/or field blanks. ▶ The results for trichloroethene, tetrachloroethene, and chlorobenzene were qualified as biased low ("L") due to slightly low LCS recoveries. ▶ All results except benzene were reported from a 50-fold dilution due to high target concentrations. Benzene was reported from a further dilution. |
| | SVOCs | ▶ The naphthalene result was reported from a secondary dilution. |
| | Metals | ▶ Results for total and dissolved chromium were qualified as nondetect ("U") at the reported concentration due to contamination identified in the method blank. |
| | Misc. | <ul style="list-style-type: none"> ▶ The sulfide result was qualified as biased low ("L") since the cited method does not include the the distillation step in the requested SW846 Method 9030B. ▶ The methane result was qualified as biased low ("L") due to analysis of the unpreserved sample one day past the 7-day holding time. |

DATA VALIDATION REPORT
ISG Sparrows Point, Inc.**

**Data Packages: 0406449 and 0406524
Validator: Peggy Schuler, URS Corporation
Report Date: November 29, 2004**

OVERVIEW

This report presents the findings from the validation of analytical data for twelve groundwater samples and one trip blank collected in support of the ISG Sparrows Point Nature and Extent Investigation in June 2004. All samples were originally collected on June 16, 2004, and submitted to Microbac Laboratories, Inc., Gascoyne Division (Gascoyne) for analysis. Due to a laboratory error, the volatiles fractions were left unrefrigerated over a weekend, rendering the samples unusable. The volatiles fractions were therefore recollected on June 22, 2004 along with five samples from another sample delivery group, and all eight were analyzed and reported in a separate data package. The list of samples, with laboratory identification numbers and analyses appears below.

Sample and Analysis Summary

- (1) **Methods:** VOC = Volatile Organic Compounds [SW-846 Method 8260B]
 SVOC = Semivolatile Organic Compounds [SW-846 Method 8270C]
 Total Mets = Total Basis Metals (Sb, As, Ba, Be, Cd, Cr, Co, Cu, Fe, Pb, Ni, Se, Ag, Tl, Sn, V, Zn, Hg) [SW-846 Methods 6010B, 6020, and 7470A]
 Diss Mets = Dissolved Basis Metals (Sb, As, Ba, Be, Cd, Cr, Co, Cu, Fe, Pb, Ni, Se, Ag, Tl, Sn, V, Zn, Hg) [SW-846 Methods 6010B, 6020, and 7470A]
 Gen Chem = Total Cyanide [SW-846 Method 9010B/9014], Available Cyanide [EPA Method 1677], Sulfide [EPA Method 376.1]

SUMMARY

All project samples were analyzed successfully by the requested methods, with the exception of sulfide (see *Minor Problems* below). No major quality control deficiencies (i.e., deficiencies resulting in the qualification of analytical results as unusable) were experienced during analysis of these samples.

Selected analytical results were qualified as estimated due to minor quality control deficiencies. These issues are discussed in the *Minor Problems* section.

MAJOR PROBLEMS

- ▶ No problems resulting in rejection of data were identified.

MINOR PROBLEMS

- ▶ Initial calibrations for four semivolatile compounds were performed with less than the required number of standards due to poor or no instrument response in the lowest calibration standard(s). The reporting limit for each of the affected compounds was elevated to the concentration of the lowest standard with good response. Since presence or absence could be adequately determined at those levels, and since none of the compounds were detected in the samples, the results were reported as non-detect at the elevated reporting limits. The results were, however, qualified as estimated (“UJ”) due to the lack of method-compliant calibrations. The affected compounds were 2,4-dinitrophenol, 3,3-dichlorobenzidine, 4-nitrophenol, and pentachlorophenol.
- ▶ Common lab contaminants acetone, 2-butanone, and methylene chloride were found in all of the volatiles method blanks. The positive results for these compounds in all samples were within ten times the blank concentration (in some cases, adjusted for dilution). Consequently, all positive results for these three compounds were qualified “U,” indicating that the concentrations found were not substantially above the level in the blank, and are therefore considered not detected at the concentration reported or the reporting limit, whichever was higher.
- ▶ Trace concentrations of the common lab contaminants 2-butanone and methylene chloride were found in the trip blank submitted with project samples. Positive results for these compounds in associated samples within ten times the blank concentration were qualified “U,” indicating that the concentrations found were not substantially above the level in the blank, and are therefore considered not detected at the concentration reported or the reporting limit, whichever was higher. Note that all samples were already qualified “U” due to the presence of these analytes in the method blank.
- ▶ The MS/MSD recoveries for tin in sample CO28-PZM048 were above the upper QC acceptance limit (139/127%; upper limit 125%). Consequently, the total and dissolved tin results in all three SDG 0406449 samples were qualified as estimated with a high bias, “K.”

- ▶ All sulfide results were qualified as estimated with a low bias, "L," due to the omission by the laboratory of the distillation step specified in the requested method, SW-846 Method 9030B.

NOTES

- ▶ Supporting documentation supplied by the laboratory was often incomplete, poorly organized, illegible, or irrelevant to the SDGs being reviewed. Much of the missing information (e.g., mass spectra for volatile and semivolatile analyses and initial calibration curves for quadratic equations) was provided by the laboratory upon request, but the effort required to reconstruct the analytical results from the raw data was, in many cases, excessive. Since that level of effort would be impractical for all of the data produced in this investigation (given the scope and schedule for the project), data assessment for the remaining data packages will consist of a general review of data quality indicators as summarized by the laboratory, without reconstruction of the data. As such, the reviewed data will be suitable for establishing nature and extent (the objective of this investigation), but will not be considered "legally defensible" as defined by USEPA Region III guidelines.
- ▶ An unusually large number of early-eluting compounds were manually integrated in the volatile organic initial and continuing calibration standards. Liberal use of manual integration can indicate an insufficient frequency of instrument maintenance or the use of outdated integration parameters, among other possible circumstances; however, it is not technically a deviation from the method and, therefore, did not result in any qualification of data. In addition, manual integrations were inconsistently identified in the data package (justification codes and analyst/supervisor signatures were often missing from the quantitation reports), and before-and-after chromatograms were not provided. Upon request, the laboratory submitted a copy of their manual integration standard operating procedure (SOP) and revised the SDG narrative to state that all manual integrations were performed in accordance with that procedure. Lacking the opportunity to examine before-and-after chromatograms, the reviewer must assume that the manual integrations performed were legitimate and properly executed, despite the documentation deficiencies.
- ▶ In the original ICP/MS metals analyses, the internal standards were below method criteria in nearly all associated continuing calibration verifications and blanks, and one or more were above method criteria in each of the samples. After discussing the problem with the laboratory, the analytical procedure was modified to match the sample and standard matrices more closely, thereby improving the internal standard responses. All samples were subsequently reanalyzed, and the original data were discarded.
- ▶ The calibration verification percent difference from the initial calibration exceeded 20% for each of six semivolatile compounds. Since the apparent bias in each case was positive, the non-detect results for these compounds in all associated samples required no qualification.

- ▶ Selected volatile and semivolatile targets were overrange in the primary analysis of one or more samples each (in some cases, the primary analysis was a dilution due to high constituent concentrations). These samples were subsequently analyzed at further dilutions to quantify the overrange targets. All overrange results in the original analyses were discarded from the final data set, and only the diluted results were retained (flagged "D" in the data tables).
- ▶ The laboratory reported inorganic analyte results between the reporting limit and one-half the reporting limit with "B" flags, in accordance with USEPA Contract Laboratory Program conventions. To be consistent with the organic data, as well as to comply with USEPA Region III guidelines, the laboratory "B" flags were changed to "J" flags.

REPORT CONTENT

The data packages for this project were reviewed following USEPA Region III guidelines presented in *Innovative Approaches to Data Validation*, dated June 1995; *Region III Modifications to National Functional Guidelines for Organic Data Review*, dated September 1994; *Region III Modifications to Laboratory Data Validation Functional Guidelines for Evaluating Inorganic Analyses*, dated April 1993; and *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods (SW-846), Third Edition*, dated June 1997.

One hundred percent of the samples were validated to USEPA Region III Levels M-3 and IM-2, as defined in *Innovative Approaches*, above. The text of this report only addresses those problems that affect data usability.

This report was prepared in accordance with USEPA Region III Standard Operating Procedure R3QA604.0, *Data Validation Report Preparation*, with the following exception: The laboratory data reports and supporting documentation for the validation findings are not included as appendices, but are available upon request. Also, the sample data are tabulated with all of the project data accompanying the overall Data Assessment Report, and have not been included separately in this report.

DATA QUALIFIERS

CODES RELATING TO IDENTIFICATION

- U = The analyte was analyzed for, but was not detected. Also used when the analyte was detected, but not substantially above the level reported in laboratory or field blanks. The associated number indicates the reporting limit, possibly elevated in the case of blank contamination.
- R = Unreliable result. Analyte may or may not be present in the sample.
- N = Tentative identification. Consider present. Special methods may be needed to confirm its presence or absence in future sampling efforts.

CODES RELATED TO QUANTITATION

- J = Analyte present. Reported value may not be accurate or precise.
- K = Analyte present. Reported value may be biased high. Actual value is expected lower.
- L = Analyte present. Reported value may be biased low. Actual value is expected to be higher.
- UJ = Not detected, quantitation limit may be inaccurate or imprecise.
- UL = Not detected, quantitation limit is probably higher.

OTHER CODES

- D = Result reported from a secondary dilution.

Analyses included volatile organic compounds (VOCs) by SW846 Method 8260B. A standard review for analytical data quality was performed by URS Corporation (URS) for the referenced sample. A standard review does not include reconstruction of the analytical data, but does include assessment of supporting quality control (QC) parameters. This includes a review of associated check sample recoveries, surrogate recoveries (where applicable), laboratory blank results, matrix spike/matrix spike duplicate recoveries, detection limits, and holding times.

Any significant findings from the review are discussed below:

1. Supporting quality control data were not submitted with the data packages originally received from the laboratory. The additional information was subsequently requested and received from Gascoyne to URS. However, it was not readily clear how to correlate the laboratory QC (i.e., LCSs and method blanks) with the project samples. It was assumed that QC could be associated based on date. In other words, the QC provided was assumed to be associated with project samples if the analytical dates corresponded. However, if multiple instruments were used and/or multiple batches were analyzed in a single, this assumption would be incorrect. Gascoyne verified that the analytical date of laboratory QC typically correlates to the project samples. However, circumstances such as those mentioned could occur. For future analyses, correlation to laboratory QC must be readily apparent to the data reviewer (e.g., batch identification).
2. Laboratory-derived QC acceptance limits were provided as well as method limits (SW846). The laboratory limits were less stringent than the method limits and several exceedances to the method limits were observed. Consequently, it was assumed that the laboratory controls off the laboratory limits. Gascoyne verified that the laboratory-derived limits are used to evaluate the data as they more closely represent current conditions (e.g., instrumentation, matrix, etc.). However, the method limits are provided for reference only. No further action was necessary.
3. The QC forms for the method blanks indicated that the date received was *after* the analysis date. It was further observed that the date received was always 1/1/2003. The laboratory response indicated that the forms must be manually updated with each use and the method blank forms were inadvertently not updated with the correct date. No further action was required.
4. All blank results for *m,p*-xylenes were hand-edited from 2 U $\mu\text{g/L}$ to 1 U $\mu\text{g/L}$. Since these isomers co-elute and often can not be distinguished separately, the laboratory was asked to substantiate the modification to the reporting limits. The laboratory confirmed that the calibration standards contain both isomers, and the lowest calibration standard is 1 $\mu\text{g/L}$, supporting a reporting limit of 1 $\mu\text{g/L}$. However, the isomers are reported as a combined value, not individually. In other words, if both isomers were present at 1 $\mu\text{g/L}$ (the low standard concentration), then the reported value for the combined isomers would be 2 $\mu\text{g/L}$, not 1 $\mu\text{g/L}$. Therefore, all nondetect results for *m,p*-xylenes were qualified as estimated (UJ).
5. Methylene chloride was detected in the method blank analyzed on 12/18/02. However, the associated project sample results were not qualified to indicate potential laboratory contamination. Sample contamination is demonstrated if the associated blank concentration is within ten times the sample concentration for common contaminants and five times for all other chemicals. Methylene chloride is considered a common contaminant and the detected concentrations in the associated project samples were less than ten times the concentration in the associated laboratory blank. Therefore, the detected concentrations of methylene chloride were assumed to be due to contamination and not actually present in the sample. Data were

qualified as nondetect (i.e., "U") at the laboratory reporting limits or reported value (whichever higher). The affected samples were as follows:

| <u>Sample ID</u> | <u>Lab ID</u> | <u>Qualification</u> |
|------------------|---------------|----------------------|
| CO30-PZM-Deep | (0212390-001) | 4.3 → 4.3 U µg/l |
| SW17-RS-25 | (0212390-002) | 1.8 → 1.8 U µg/l |
| CP17-RS-25 | (0212406-001) | 1.4 → 1.4 U µg/l |
| WT-121802 | (0212406-002) | 2.3 → 2.3 U µg/l |
| CP17-RS-35 | (0212410-001) | 3.2 → 3.2 U µg/l |

6. Similar to comment #5 above, methylene chloride was detected at 4 µg/L in the method blank analyzed on 2/5/03. The only associated project sample that also contained methylene chloride was CO33-RS-105 and the result was qualified with a "B." However, the note on the hardcopy indicated that the methylene chloride concentration in the method blank was 1000 µg/L rather than 4 µg/L. Since a 250x dilution was performed for this sample, it was assumed that the method blank concentration was also multiplied by the sample's dilution factor. The laboratory verified this assumption. In other words, the method blank concentration for methylene chloride was actually 4 µg/L, rather than 1000 µg/L as implied on the sample result form. It is agreed that the methylene chloride concentration in the sample was likely due to trace on-column contamination (as demonstrated by the method blank) and then further multiplied by the sample dilution factor, resulting in a deceptively high concentration. However, the method blank concentration should be reported accurately (i.e., a dilution factor should not be applied unless a dilution was performed). In conclusion, the sample concentration was qualified as nondetect (300 U µg/L) due to laboratory contamination.

7. Most samples demonstrated acceptable surrogate recoveries. Some samples had high recoveries for one of three surrogates indicating a possible high bias. In select cases, surrogate recoveries were below QC acceptance limits. Typically if more than one of three surrogates were below QC acceptance limits, but greater than or equal to 10% recovery, associated data were qualified as estimated. In all cases, two of the three surrogates met criteria and/or surrogate recoveries were above 10%. No qualification of data was required.

APPENDIX D

**Key to Data Qualifiers
Nature & Extent Investigation
ISG Sparrows Point, Inc.**

| Qualifier | Definition |
|------------------|---|
| U | The analyte was analyzed for, but was not detected. Also used when the analyte was detected, but not substantially above the level reported in laboratory or field blanks. The associated number indicates the reporting limit. |
| R | Unreliable result. Analyte may or may not be present in the sample. |
| J | Analyte present. Reported value may not be accurate or precise. |
| K | Analyte present. Reported value may be biased high. Actual value is expected to be lower. |
| L | Analyte present. Reported value may be biased low. Actual value is expected to be higher. |
| UJ | Not detected, quantitation limit may be inaccurate or imprecise. |
| UL | Not detected, quantitation limit is probably higher. |
| D | Result reported from a secondary dilution. |
| -- | Not analyzed. |
